

Introduction to customizing WordPress using functions.php

Budapest WordPress meetup

05/02/2015

WordPress is a tweaker's paradise

How many times have you read on the forums?

Just paste this code
into your theme's **functions.php**

functions.php

“You can use it to call functions, both PHP and built-in WordPress, and to define your own functions”

(WordPress Codex)

- + automatically loaded in both admin and front-end pages
- + can add features/extend functionality of both theme and WP installation
- If theme is changed, features/functionality is lost
- messy if you plan on inserting more than a handful of code
- white screen of death

/root-folder

/wp-admin

/wp-content

/plugins

/themes

/themename

/functions.php

Remember: it is best NOT to touch the functions.php file in an existing theme, but rather create a «child theme» that only contains the modifications.

See: [http://codex.wordpress.org/Child Themes](http://codex.wordpress.org/Child_Themes)

Practical example

Add custom CSS class to first paragraph in blog posts

```
function highlight_first_paragraph($content){
    global $post;
    if ($post->post_type == "post"){
        return preg_replace('/<p([>]+)?>/', '<p$1 class="first">', $content, 1); }
    else {
        return $content;
    }
}

add_filter('the_content', 'highlight_first_paragraph');
```

BUT...

design and functionality should be clearly separated

design -> themes

functionality -> plugins

plugin

- Requires specific, unique Header text
- Is stored in wp-content/plugins, usually in a subdirectory
- Executes only when individually activated, via the Plugins panel
- Applies to all themes
- Best if meant for a single purpose

Example: Define header for custom plugin

```
<?php
/**
 * Plugin Name: Custom Functions
 * Plugin URI: http://wpbudapest.com
 * Description: Custom functions for WP site (no UI).
 * Author: LS
 * Author URI: http://wpbudapest.com
 * Version: 1.0
 */
```

Finding a middle ground

1. create a folder in your child theme and recursively include the snippets
2. Include php snippets in that folder programmatically from functions.php

+ easier to maintain

+ less mess

1. Create folder and php files

`/root-folder`

`/wp-admin`

`/wp-content`

`/plugins`

`/themes`

`/themename`

`/snippets`

`/login_custom_logo.php`

`/post_first_paragraph.php`

`/etc.`

2. Add code to functions.php

```
/* include all PHP files in ./snippets/ folder */  
foreach ( glob( dirname( __FILE__ ) . '/snippets/*.php' ) as $file )  
    include $file;
```

Alternatives

So-called «functionality» plugins

Functionality

<https://wordpress.org/plugins/functionality/>

My Custom Functions
